Abstract of JP2002149549

PROBLEM TO BE SOLVED: To efficiently perform an information recording service in regard to information contents which some access routes can be expected of.

SOLUTION: When a user issues a print request of the information contents, e.g. on a portable terminal, contents are spooled and a pass code is returned to the user. When the user inputs the pass code on an information output device installed at a desired place, the spooled contents are transferred to the information output device. And information output results can be obtained. Since the contents are favorably spooled, processing is performed efficiently from pass code entry up to information output.
